1. A method of determining an uncoded bit error rate  $p_b$  based on a target symbol error rate  $\varepsilon_s$ , comprising:

determining the uncoded bit error rate  $p_b$  based on a weighted series expansion of the target symbol error rate  $\varepsilon_s$ , comprising weights W that are a function of a maximum number of symbol errors that can be corrected t and a number of symbols in an information field K; and

selecting the maximum number of symbol errors t and the number of symbols in the information field K such that the uncoded bit error rate  $p_b$  that produces a symbol error rate that is less than or equal to the target symbol error rate  $\varepsilon_b$  is largest.

- 2. The method of claim 1 wherein the weighted series expansion comprises at least a first term, wherein second order and higher terms are ignored to determine the uncoded bit error rate  $p_b$ .
  - 3. The method of claim 1 wherein the symbols comprise Reed-Solomon symbols.
- 4. The method of claim 1 wherein the weighted series expansion to determine the uncoded bit error  $p_b$  rate comprises the following relationship:

$$p_{b} = 1 - \left(1 - W(t, K) \varepsilon_{S}^{\frac{1}{(t+1)}}\right)^{1/\alpha}$$

wherein

7

$$W(t,K) = \left[ \binom{K+C+R-1}{t} \right]^{\frac{1}{(t+1)}},$$

 $\varepsilon_s$  represents a target symbol error rate, and C + R represents a number of symbols in an error correction field.

5. A method of determining an optimum bit load per subchannel in a multicarrier system with forward error correction, comprising:

computing one or more values of a maximum number of symbol errors that can be corrected t, and a number of symbols in the information field K to determine the optimum bit load per subchannel in accordance with the following relationship:

$$1 - \left(1 - W(t, K)\varepsilon_{S}^{\frac{1}{t+1}}\right)^{1/\alpha} = \omega(b)\left(1 - 2^{-b_{i}(t, K)/2}\right) erfc\left(\sqrt{3 \cdot 10^{\gamma_{i}/10}} / \left(2^{b_{i}(t, K)+1} - 2\right)\right)$$

$$\times \left[2 - \left(1 - 2^{-b_{i}(t, K)/2}\right) erfc\left(\sqrt{3 \cdot 10^{\gamma_{i}/10}} / \left(2^{b_{i}(t, K)+1} - 2\right)\right)\right]$$

wherein 
$$W(t,K) = \begin{bmatrix} K+C+R-1 \\ t \end{bmatrix} \frac{1}{(t+1)}$$
,

$$\omega(b) = \frac{1}{b \cdot 2^b} \sum_{i=1}^{2^b} \sum_{j=1}^{2^b} \frac{d_H(a_i, a_j)}{\chi_i},$$

 $\varepsilon_i$  represents a target symbol error rate, C + R represents a number of symbols in an error correction field, b represents a number of bit positions of a quadrature-amplitude-modulation symbol,  $\omega(b)$  represents an average fraction of erroneous bits in an erroneous b-sized quadrature-amplitude-modulation symbol,  $a_i$  represents a label for the  $i^{th}$  point of a constellation associated with a subchannel,  $a_i$ 

represents a label for the  $j^{th}$  point of a constellation associated with a subchannel,  $\chi_i$  represents a coordination number of the  $a_i^{th}$  point,  $d_H(a_i, a_j)$  represents a Hamming distance between respective binary vectors associated with points  $a_i$  and  $a_j$ ; and

selecting the maximum number of symbol errors that can be corrected t, and the number of symbols in the information field K such that the uncoded bit error rate  $p_b$  that produces a symbol error rate that is less than or equal to the target symbol error rate is increased.

6. A method of determining an optimum bit load per subchannel in a multicarrier system with forward error correction, comprising:

computing one or more values of a maximum number of symbol errors that can be corrected t, and a number of symbols in the information field K to determine the optimum bit load per subchannel in accordance with the following relationship:

$$1 - \left(1 - W(t, K)e_s^{\frac{1}{t+1}}\right)^{1/\alpha} = \omega(b)\left(1 - 2^{-b_i(t, K)/2}\right) erfc\left(\sqrt{3 \cdot 10^{\gamma_i/10}} / \left(2^{b_i(t, K)+1} - 2\right)\right) \times \left[2 - \left(1 - 2^{-b_i(t, K)/2}\right) erfc\left(\sqrt{3 \cdot 10^{\gamma_i/10}} / \left(2^{b_i(t, K)+1} - 2\right)\right)\right]$$

wherein 
$$W(t,K) = \begin{bmatrix} \binom{K+C+R-1}{t} \end{bmatrix}^{\frac{1}{(t+1)}}$$
,

 $\varepsilon_a$  represents a target symbol error rate, C + R represents a number of symbols in an error correction field, b represents a number of bit positions of a quadrature-amplitude-modulation symbol,  $\omega(b)$  represents an approximate average fraction of erroneous bits in an erroneous b-sized quadrature-amplitude-modulation symbol; and

selecting the maximum number of symbol errors that can be corrected t, and the number of symbols in the information field K such that the uncoded bit error rate  $p_b$  that produces a symbol error rate that is less than or equal to the target symbol error rate is increased.

- 7. The method of claim 6 wherein  $\omega(b_i)$  is determined in accordance with the following relationship:
- $\omega(b_i) = \frac{4}{3+2b_i}$

1

- 8. A method of selecting forward error correction parameters in a channel having
  a plurality of subchannels in a multicarrier communications system, comprising:
  determining a signal-to-noise ratio representing a subset of the subchannels;
  and
  selecting forward error correction parameters of the channel based on the
  signal-to-noise ratio.
- 1 9. The method of claim 8 wherein the subset of the subchannels comprises all of 2 the subchannels of the channel.
- 1 10. The method of claim 8 wherein the forward error correction parameters are utilized in Reed-Solomon encoding.
- 1 11. The method of claim 8 wherein the signal-to-noise ratio is an average 2 signal-to-noise ratio of respective signal-to-noise ratios of the subset of the 3 subchannels.

- 1 12. The method of claim 8 wherein the signal-to-noise ratio represents all of the
- 2 subchannels.
- 1 13. The method of claim 8 wherein the selecting comprises applying a mean field
- approximation to evaluate a bit load over the subset of subchannels.
- 1 14. The method of claim 13 wherein the selecting comprises adjusting the mean
- 2 field approximation.
- 15. The method of claim 14 wherein the adjusting is applied when the number of
- bits per subchannel is less than or equal to two.
- 1 16. The method of claim 14 wherein the adjusting is a linear adjustment with
- 2 respect to a bit load of a subchannel.
- 1 17. The method of claim 8 further comprising:
- determining the representative performance measurement as an average
- signal-to-noise ratio  $\gamma_{eff}$  for the channel in accordance with the following
- 4 relationship:

6

$$\gamma_{\text{eff}} = \frac{1}{n_{\text{eff}}} \sum_{r_i > r_s} \gamma_i$$
, wherein

7 8

$$n_{\rm eff} = \sum_{x>x} 1,$$

- $\gamma_i$  represents a signal-to-noise measurement for an ith subchannel, and  $n_{eff}$
- represents a number of subchannels for which the signal-to-noise ratio  $\gamma$ , was

measured for which  $\gamma_i$  is greater than  $\gamma_*$ , and  $\gamma_*$  represents a threshold signal-to-noise ratio.

18. A method of determining a bit load b per subchannel in a multicarrier system with forward error correction, comprising:

computing one or more values of a maximum number of symbol errors that can be corrected t, and a number of symbols in the information field K to determine the bit load per subchannel in accordance with the following relationship:

$$b = [\gamma + \Phi(\gamma, t, K, \varepsilon)]/10 \log 2,$$

wherein

$$\Phi(\gamma, t, K, \varepsilon) = 10 \log \left\{ 10^{-\gamma/10} + \frac{3 \log e}{2 \log \left[ \frac{\alpha \langle \omega(b) \rangle \sqrt{8/\pi}}{W(t, K)(\alpha \varepsilon / \beta)^{\frac{1}{(t+1)}}} \right] - \log \log \left[ \frac{\alpha \langle \omega(b) \rangle \sqrt{8/\pi}}{W(t, K)(\alpha \varepsilon / \beta)^{\frac{1}{(t+1)}}} \right] + \log \left( \frac{\log e}{2} \right) \right\}$$

$$W(t,K) = \left[ \binom{K+C+R-1}{t} \right]^{\frac{1}{(t+1)}} \left[ \binom{K+C+R}{t+1} \right]^{\frac{k-1}{(t+1)}}$$

$$\langle \omega(b) \rangle = \frac{1}{b_{\text{max}}} \int_{1}^{b_{\text{max}}} \omega(b) (1 - 2^{-b/2}) db$$

 $\alpha$  represents a number of bits per symbol,  $\gamma$  represents a signal-to-noise ratio, t represents a maximum number of symbol errors that can be corrected,  $\epsilon$  represents a target bit error rate, C + R represents a number of symbols in an error correction field,

23.

1

19	b rep	b represents a number of bit positions of a quadrature-amplitude-modulation symbol,			
20	ω(b):	$\omega(b)$ represents an average fraction of erroneous bits in an erroneous b-sized			
21	quadı	quadrature-amplitude-modulation symbol, $b_{max}$ is a maximum bit load per			
22	subch	subchannel; and			
23		selecting a bit load per subchannel in accordance with the maximum number			
24	of syr	of symbol errors that can be corrected t, and a number of symbols in the information			
25	field $K$ .				
1	19.	The method of claim 18 wherein $\Phi(\gamma, t, K, \varepsilon)$ is evaluated at $\gamma$ equals $-\infty$ .			
1	20.	The method of claim 18 wherein b is greater than or equal to three.			
1	21.	A method of selecting forward error correction parameters for use in a channel			
2	havin	g a plurality of subchannels, comprising:			
3		determining an average signal-to-noise ratio of at least a subset of the			
4	subch	subchannels; and			
5		selecting forward error correction parameters based on the average signal-to-noise			
6	ratio,	ratio, and a count of the number of subchannels in the subset.			
1	22.	The method of claim 21 wherein the selecting the forward error correction			
2	paran	neters comprises; selecting the forward error correction parameters based on a			
3	predic	eted gain from application of the selected forward error correction parameters.			

The method of claim 22 wherein the gain is a performance gain.

24. A method of selecting at least one forward error correction parameter, comprising:

computing one or more values representing a number of information symbols K in a frame accordance with the following relationship:

$$\left[\frac{\alpha(K+s+zs)}{s \, n_{eff}} + 1.5\right] \left[1 - \left(1 - \left(\left(\frac{K+C+R-i}{r}\right)\right)^{\frac{1}{(t+1)}}\right)^{\frac{1}{(t+1)}}\right]^{\frac{1}{(t+1)}} \\
= 2\left(1 - 2^{\frac{\alpha(K+s+zs)}{2sn_{eff}}}\right) erfc \sqrt{1.5 \cdot 10^{\gamma_{eff}/10}} \sqrt{2^{\frac{\alpha(K+s+zs)}{sn_{eff}}} - 1}\right) \\
\times \left[2 - \left(1 - 2^{\frac{\alpha(K+s+zs)}{2sn_{eff}}}\right) erfc \sqrt{1.5 \cdot 10^{\gamma_{eff}/10}} \sqrt{2^{\frac{\alpha(K+s+zs)}{sn_{eff}}} - 1}\right)\right]$$

wherein 
$$t = \left\lfloor \frac{sz + 1 + e_r}{2} \right\rfloor$$
,  $e_r \le sz$ , and

s represents a number of discrete multi-tone symbols in a frame, z represents a number of error correction symbols in a discrete multi-tone symbol,  $\alpha$  represents a number of bits per code symbol, C+R represents a number of redundant symbols in an error correction field,  $n_{eff}$  represents a number of subchannels exceeding a threshold performance value,  $\gamma_{eff}$  represents an effective signal-to-noise ratio associated with the number of subchannels exceeding the threshold performance value,  $\varepsilon_s$  represents a target symbol error rate; and  $e_r$  represents a number of erasures; and

determining a number of bits per subchannel in accordance with the one or more values of K.

1	25.	The method of claim 24 wherein $K$ is a continuous variable.		
i	26.	The method of claim 24 wherein K is computed using dichotomy, for values		
2	of $\gamma_{eff}$	$n_{eff}$ , $z_s$ and $s_s$ .		
1	27.	The method of claim 24 further comprising:		
2	,	determining a net coding gain associated with values of $\gamma_{eff}$ , $n_{eff}$ , $z_s$ and $s$ ;		
3		determining an incremental number of bits per subchannel associated with the		
4	net co	net coding gain; and		
5		storing associated values of $\gamma_{eff}$ , $n_{eff}$ , $z_s$ and the incremental number of bits		
6	per si	ubchannel.		
1	28.	A method of selecting transmission parameters of a multicarrier system		
2	havin	g a channel comprising a plurality of subchannels, comprising:		
3		selecting a number (s) of discrete multi-tone symbols in a		
4	forwa	ard-error-correction frame, and a number (z) of forward-error-correction control		
5	symb	ols in a discrete multitone symbol based on a signal-to-noise ratio and a number		
6	of su	bechannels associated with the signal-to-noise ratio; and		
7		transmitting information in accordance with the selected number (s) of		
8	discr	discrete multi-tone symbols, and a number (z) of forward-error-correction control		
9	symb	ols in the discrete multitone symbol.		
1	29.	The method of claim 28 wherein the selecting comprises selecting an		
2 '	adjus	tment value per subchannel based on the signal-to-noise ratio and the number of		
3	subcl	nannels associated with the signal-to-noise ratio; and		
4		adjusting a number of bits per subchannel for at least one subchannel in		
5	accor	dance with the adjustment value.

1	30. The method of claim 28 wherein the signal-to-noise ratio is an average		
2	signal-to-noise ratio of the associated number of subchannels.		
1	31. The method of claim 28 further comprising:		
2	storing, in a table, the number (s) of discrete multi-tone symbols in the		
3	forward-error-correction frame, the number (z) of forward-error-correction control		
4	symbols in the discrete multitone symbol associated with the signal-to-noise ratio and		
5	the number of subchannels associated with the signal-to-noise ratio, for different		
6	values of s, z, signal-to-noise ratios and numbers of subchannels.		
1	32. The method of claim 31 wherein for each value of signal-to-noise ratio and		
2	number of bits per subchannel of the table, the associated value of s and z provide a		
3	maximal net coding gain $g_n$ , and the associated value of s and z is selected from a		

33. An apparatus for determining an uncoded bit error rate  $p_b$  based on a target symbol error rate  $\varepsilon_s$ , comprising:

subset of associated s and z values.

means for determining the uncoded bit error rate  $p_b$  based on a weighted series expansion of the target symbol error rate  $\varepsilon_s$ , comprising weights W that are a function of a maximum number of symbol errors that can be corrected t and a number of symbols in an information field K; and

means for selecting the maximum number of symbol errors t and the number of symbols in the information field K such that the uncoded bit error rate  $p_b$  that produces a symbol error rate that is less than or equal to the target symbol error rate  $\varepsilon_s$  is largest.

34. The apparatus of claim 33 wherein the weighted series expansion comprises at least a first term, wherein second order and higher terms are ignored to determine the uncoded bit error rate  $p_b$ .

- 35. The apparatus of claim 33 wherein the symbols comprise Reed-Solomon symbols.
- 1 36. The apparatus of claim 33 wherein the weighted series expansion to determine the uncoded bit error  $p_b$  rate comprises the following relationship:

$$4 p_b = 1 - \left(1 - W(t, K) \varepsilon_S^{\frac{1}{(t+1)}}\right)^{1/\alpha}$$

6 wherein

8 
$$W(t,K) = \left[ \binom{K+C+R-1}{t} \right]^{-\frac{1}{(t+1)}},$$

 $\varepsilon_s$  represents a target symbol error rate, and C + R represents a number of symbols in an error correction field.

37. An apparatus for determining an optimum bit load per subchannel in a multicarrier system with forward error correction, comprising:

means for computing one or more values of a maximum number of symbol errors that can be corrected t, and a number of symbols in the information field K to determine the optimum bit load per subchannel in accordance with the following relationship:

$$1 - \left(1 - W(t, K)\varepsilon_{s}^{\frac{1}{t+1}}\right)^{1/\alpha} = \omega(b)\left(1 - 2^{-b_{s}(t, K)/2}\right) erfc\left(\sqrt{3 \cdot 10^{\gamma_{s}/10}} / \left(2^{b_{s}(t, K)+1} - 2\right)\right)$$

$$\times \left[2 - \left(1 - 2^{-b_{s}(t, K)/2}\right) erfc\left(\sqrt{3 \cdot 10^{\gamma_{s}/10}} / \left(2^{b_{s}(t, K)+1} - 2\right)\right)\right]$$

wherein 
$$W(t,K) = \begin{bmatrix} K+C+R-1 \\ t \end{bmatrix}^{\frac{1}{(t+1)}}$$
,

$$\omega(b) = \frac{1}{b \cdot 2^b} \sum_{i=1}^{2^b} \sum_{j \neq i}^{\chi_i} \frac{d_H(a_i, a_j)}{\chi_i},$$

 $\varepsilon_i$  represents a target symbol error rate, C + R represents a number of symbols in an error correction field, b represents a number of bit positions of a quadrature-amplitude-modulation symbol,  $\omega(b)$  represents an average fraction of erroneous bits in an erroneous b-sized quadrature-amplitude-modulation symbol,  $a_i$  represents a label for the  $i^{th}$  point of a constellation associated with a subchannel,  $a_i$  represents a label for the  $j^{th}$  point of a constellation associated with a subchannel,  $\chi_i$  represents a coordination number of the  $a_i^{th}$  point,  $d_H(a_b a_j)$  represents a Hamming distance between respective binary vectors associated with points  $a_i$  and  $a_j$ ; and

means for selecting the maximum number of symbol errors that can be corrected t, and the number of symbols in the information field K such that the uncoded bit error rate  $p_b$  that produces a symbol error rate that is less than or equal to the target symbol error rate is increased.

38. An apparatus for determining an optimum bit load per subchannel in a multicarrier system with forward error correction, comprising:

means for computing one or more values of a maximum number of symbol errors that can be corrected t, and a number of symbols in the information field K to determine the optimum bit load per subchannel in accordance with the following relationship:

$$1 - \left(1 - W(t, K)e_{S}^{\frac{1}{t+1}}\right)^{1/\alpha} = \omega(b)\left(1 - 2^{-b_{i}(t, K)/2}\right) erfc\left(\sqrt{3 \cdot 10^{\gamma_{i}/10}} / \left(2^{b_{i}(t, K)+1} - 2\right)\right)$$

$$\times \left[2 - \left(1 - 2^{-b_{i}(t, K)/2}\right) erfc\left(\sqrt{3 \cdot 10^{\gamma_{i}/10}} / \left(2^{b_{i}(t, K)+1} - 2\right)\right)\right]$$

wherein 
$$W(t,K) = \begin{bmatrix} \binom{K+C+R-1}{t} \end{bmatrix}^{\frac{1}{(t+1)}}$$
,

 $\varepsilon_r$  represents a target symbol error rate, C + R represents a number of symbols in an error correction field, b represents a number of bit positions of a quadrature-amplitude-modulation symbol,  $\omega(b)$  represents an approximate average fraction of erroneous bits in an erroneous b-sized quadrature-amplitude-modulation symbol; and

selecting the maximum number of symbol errors that can be corrected t, and the number of symbols in the information field K such that the uncoded bit error rate  $p_b$  that produces a symbol error rate that is less than or equal to the target symbol error rate is increased.

39. The apparatus of claim 38 wherein  $\omega(b_i)$  is determined in accordance with the following relationship:

$$\omega(b_i) = \frac{4}{3+2b_i}$$

- 5+20<sub>i</sub>
- 1 40. An apparatus for selecting forward error correction parameters in a channel
- 2 having a plurality of subchannels in a multicarrier communications system,
- 3 comprising:

47.

1

2

4	means for determining a signal-to-noise ratio representing a subset of the		
5	subchannels; and		
6	means for selecting forward error correction parameters of the channel based		
7	on the signal-to-noise ratio.		
	The apparatus of claim 40 wherein the subset of the subchannels comprises a		
1	• •		
2	of the subchannels of the channel.		
1	42. The apparatus of claim 40 wherein the forward error correction parameters as		
2	utilized in Reed-Solomon encoding.		
2	· ·		
1	43. The apparatus of claim 40 wherein the signal-to-noise ratio is an average		
2	signal-to-noise ratio of respective signal-to-noise ratios of the subset of the		
3	subchannels.		
1	44. The apparatus of claim 40 further comprising:		
2	means for determining a signal-to-noise ratio representing all of the		
3	subchannels.		
	45. The apparatus of claim 40 wherein the means for selecting comprises means		
1	••		
2	for applying a mean field approximation to evaluate a bit load over the subset of		
3	subchannels.		
1	46. The apparatus of claim 40 wherein the means for selecting comprises means		
2	for adjusting the mean field approximation.		

The apparatus of claim 46 wherein the means for adjusting is applied when

the number of bits per subchannel is less than or equal to two.

- 1 48. The apparatus of claim 46 wherein the means for adjusting is a linear adjustment with respect to a bit load of a subchannel.
- 1 49. The apparatus of claim 46 further comprising:
- means for determining the representative performance measurement as an average signal-to-noise ratio  $\gamma_{eff}$  for the channel in accordance with the following relationship:

4 relation

7

9

1

5

7

6  $\gamma_{eff} = \frac{1}{n_{eff}} \sum_{\gamma_i > \gamma_c} \gamma_i$ , wherein

 $n_{eff} = \sum_{\gamma_i > \gamma_e} 1,$ 

 $\gamma_i$  represents a signal-to-noise ratio measurement for an ith subchannel, and  $n_{eff}$  represents a number of subchannels for which the signal-to-noise ratio  $\gamma_i$  was measured for which  $\gamma_i$  is greater than  $\gamma_i$ , and  $\gamma_i$  represents a threshold signal-to-noise ratio.

- 50. The apparatus of claim 49 further comprising:
- means for determining the representative performance measurement as an average signal-to-noise ratio  $\gamma_{eff}$  for the channel in accordance with the following relationship:

6  $\gamma_{eff} = \frac{1}{n_{eff}} \sum_{\gamma_i > \gamma_c} \gamma_c$ , wherein

$$n_{eff} = \sum_{\gamma_i \geq \gamma} 1,$$

 $\gamma_i$  represents a signal-to-noise measurement for an ith subchannel, and  $n_{eff}$  represents a number of subchannels for which the signal-to-noise ratio  $\gamma_i$  was measured for which  $\gamma_i$  is greater than or equal to than  $\gamma_i$ , and  $\gamma_i$  represents a threshold signal-to-noise ratio.

51. An apparatus for determining a bit load b per subchannel in a multicarrier system with forward error correction, comprising:

means for computing one or more values of a maximum number of symbol errors that can be corrected t, and a number of symbols in the information field K to determine the bit load per subchannel in accordance with the following relationship:

$$b = [\gamma + \Phi(\gamma, t, K, \varepsilon)]/10 \log 2,$$

wherein

$$=10\log\left\{10^{-\gamma/10} + \frac{3\log e}{2\log\left[\frac{\alpha\langle\omega(b)\rangle\sqrt{8/\pi}}{W(t,K)(\alpha\varepsilon/\beta)^{\frac{1}{(t+1)}}}\right] - \log\log\left[\frac{\alpha\langle\omega(b)\rangle\sqrt{8/\pi}}{W(t,K)(\alpha\varepsilon/\beta)^{\frac{1}{(t+1)}}}\right] + \log\left(\frac{\log e}{2}\right)\right\}$$

$$W(t,K) = \left[ \binom{K+C+R-1}{t} \right]^{\frac{1}{(t+1)}} \left[ \binom{K+C+R}{t+1} \right]^{\frac{k-1}{(t+1)}}$$

$$\langle \omega(b) \rangle = \frac{1}{b_{\text{max}}} \int_{1}^{b_{\text{max}}} \omega(b) (1 - 2^{-b/2}) db$$

 $\alpha$  represents a number of bits per symbol,  $\gamma$  represents a signal-to-noise ratio, t represents a maximum number of symbol errors that can be corrected,  $\varepsilon$  represents a target bit error rate, C + R represents a number of symbols in an error correction field, b represents a number of bit positions of a quadrature-amplitude-modulation symbol,  $\omega(b)$  represents an average fraction of erroneous bits in an erroneous b-sized quadrature-amplitude-modulation symbol,  $b_{max}$  is a maximum bit load per subchannel; and

means for selecting a bit load per subchannel in accordance with the maximum number of symbol errors that can be corrected t, and a number of symbols in the information field K.

- 52. The apparatus of claim 51 wherein  $\Phi(\gamma, t, K, \varepsilon)$  is evaluated at  $\gamma$  equals  $-\infty$ .
- 1 53. The apparatus of claim 51 wherein b is greater than or equal to three.
  - 54. An apparatus for selecting forward error correction parameters for use in a channel having a plurality of subchannels, comprising:
  - means for determining an average signal-to-noise ratio of at least a subset of the subchannels; and
  - means for selecting forward error correction parameters based on the average signal-to-noise ratio, and a count of the number of subchannels in the subset.
- The apparatus of claim 54 wherein the means for selecting the forward error correction parameters selects the forward error correction parameters based on a predicted gain from application of the selected forward error correction parameters.

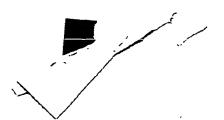

- 56. The apparatus of claim 55 wherein the gain is a performance gain.
- 57. An apparatus for selecting at least one forward error correction parameter, comprising:
- means for computing one or more values representing a number of information symbols K in a frame accordance with the following relationship:

$$\left[\frac{\alpha(K+s+zs)}{s \, n_{eff}} + 1.5\right] \left[1 - \left(1 - \left(\left[\binom{K+C+R-1}{t}\right]^{\frac{1}{(t+1)}}\right)^{\frac{1}{(t+1)}}\right)^{\frac{1}{(t+1)}}\right] \\
= 2\left(1 - 2^{\frac{\alpha(K+s+zs)}{2sn_{eff}}}\right) \operatorname{erfc}\left(\sqrt{1.5 \cdot 10^{\gamma_{eff}/10}} \left(2^{\frac{\alpha(K+s+zs)}{sn_{eff}}} - 1\right)\right) \\
\times \left[2 - \left(1 - 2^{\frac{\alpha(K+s+zs)}{2sn_{eff}}}\right) \operatorname{erfc}\left(\sqrt{1.5 \cdot 10^{\gamma_{eff}/10}} \sqrt{2^{\frac{\alpha(K+s+zs)}{sn_{eff}}} - 1}\right)\right]$$

8 wherein 
$$t = \left\lfloor \frac{sz + 1 + e_r}{2} \right\rfloor$$
,  $e_r \le sz$ , and

- s represents a number of discrete multi-tone symbols in a frame, z represents a number of error correction symbols in a discrete multi-tone symbol,  $\alpha$  represents a number of bits per code symbol, C+R represents a number of redundant symbols in an error correction field,  $n_{eff}$  represents a number of subchannels exceeding a threshold performance value,  $\gamma_{eff}$  represents an effective signal-to-noise ratio associated with the number of subchannels exceeding the threshold performance value,  $\varepsilon_s$  represents a target symbol error rate; and  $e_r$  represents a number of erasures; and
- means for determining a number of bits per subchannel in accordance with the one or more values of K.

1	58. The apparatus of claim 57 wherein $K$ is a continuous variable.		
1	59. The apparatus of claim 57 wherein K is computed using dichotomy, fo	r value	
2	of $\gamma_{eff}$ , $n_{eff}$ , $z$ , and $s$ .		
1	60. The apparatus of claim 57 further comprising:		
2	means for determining a net coding gain associated with values of $\gamma_{eff}$ ,	n <sub>eff</sub> , z,	
3	and s;		
4	means for determining an incremental number of bits per subchannel		
5	associated with the net coding gain; and		
6	means for storing associated values of $\gamma_{eff}$ , $n_{eff}$ , $z_s$ and the incremental	l	
7	number of bits per subchannel.		
1	61. An apparatus for selecting transmission parameters of a multicarrier sy	stem	
2	having a channel comprising a plurality of subchannels, comprising:		
<b>3</b>	means for selecting a number (s) of discrete multi-tone symbols in a		
4	forward-error-correction frame, and a number (z) of forward-error-correction	control	
5	symbols in a discrete multitone symbol based on a signal-to-noise ratio and a	ıumber	
6	of subchannels associated with the signal-to-noise ratio; and		
7	means for transmitting information in accordance with the selected nur	nber (s	
8	of discrete multi-tone symbols, and a number (z) of forward-error-correction of	ontrol	
9	symbols in the discrete multitone symbol.		
1	62. The apparatus of claim 61 wherein the means for selecting comprises:		
2	selecting an adjustment value per subchannel based on the signal-to-no	ise	
3	ratio and the number of subchannels associated with the signal-to-noise ratio;	and	
4	means for adjusting a number of bits per subchannel for at least one		
5	subchannel in accordance with the adjustment value.		

- 1 63. The apparatus of claim 61 wherein the signal-to-noise ratio is an average 2 signal-to-noise ratio of the associated number of subchannels.
  - 64. The apparatus of claim 61 further comprising:

means for storing, in a table, the number (s) of discrete multi-tone symbols in the forward-error-correction frame, the number (z) of forward-error-correction control symbols in the discrete multitone symbol associated with the signal-to-noise ratio and the number of subchannels associated with the signal-to-noise ratio, for different values of s, z, signal-to-noise ratios and numbers of subchannels.

65. The apparatus of claim 64 wherein for each value of signal-to-noise ratio and number of bits per subchannel of the table, the associated value of s and z provides a maximal net coding gain, and the associated value of s and z is selected from a subset of associated s and z values.
